UML Diagrams

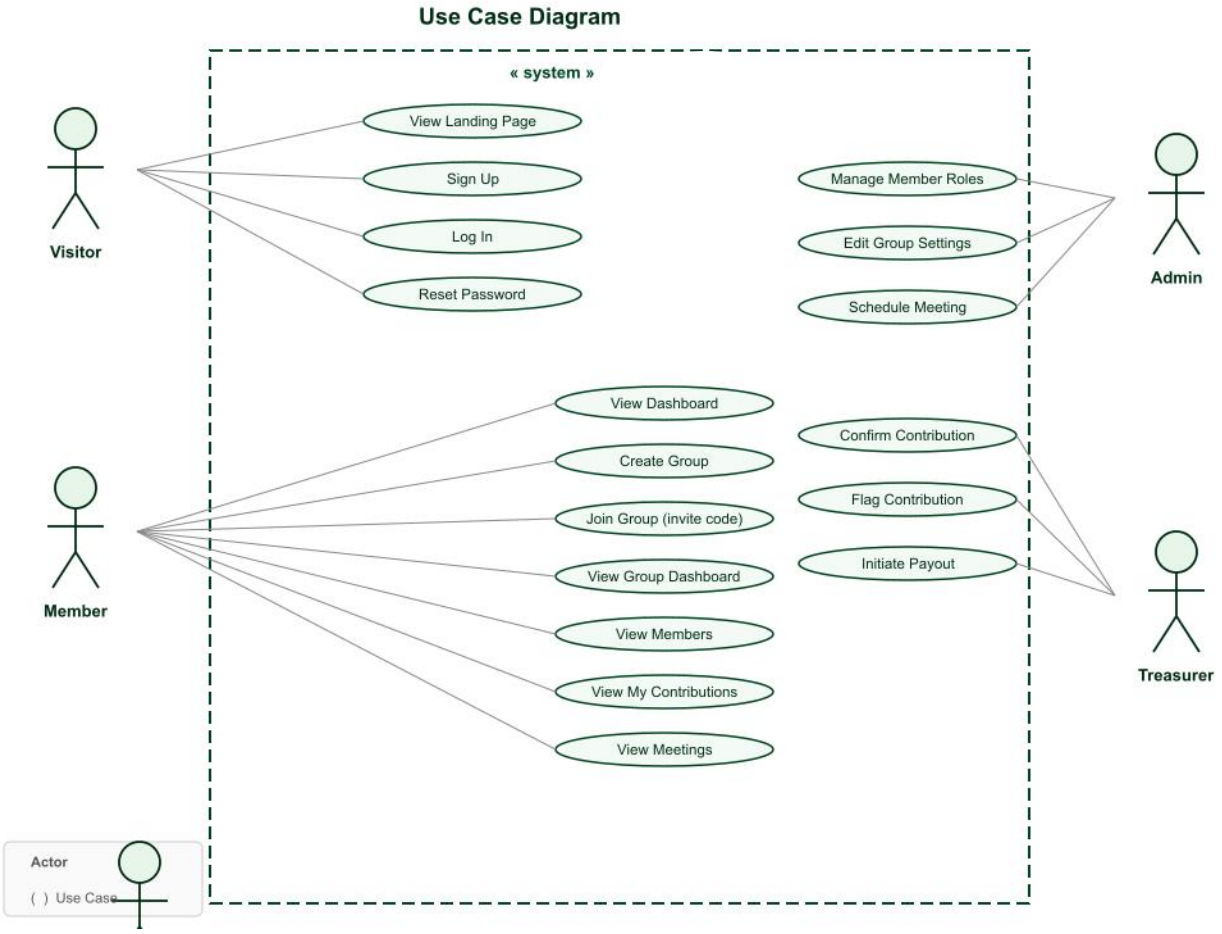
RateLimitRefugees • April 2026

This document contains four UML diagrams:

1. Use Case Diagram — who can do what
2. Component Diagram — application layers and connections
3. Entity Relationship Diagram — database schema
4. Sequence Diagram — step-by-step login flow

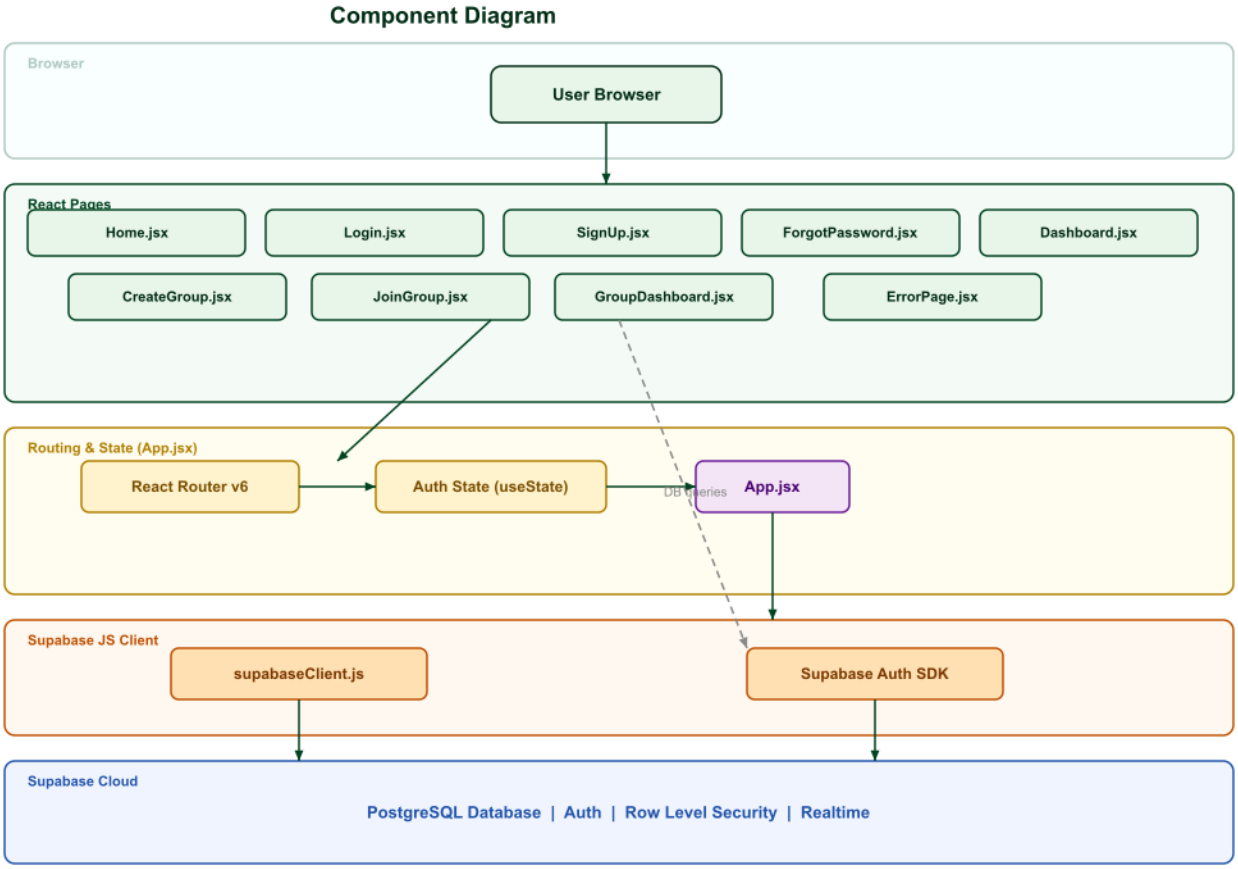
1. Use Case Diagram

Three actor types: Visitor (public pages only), Member (full group management), Admin and Treasurer (elevated permissions over group config and financials).



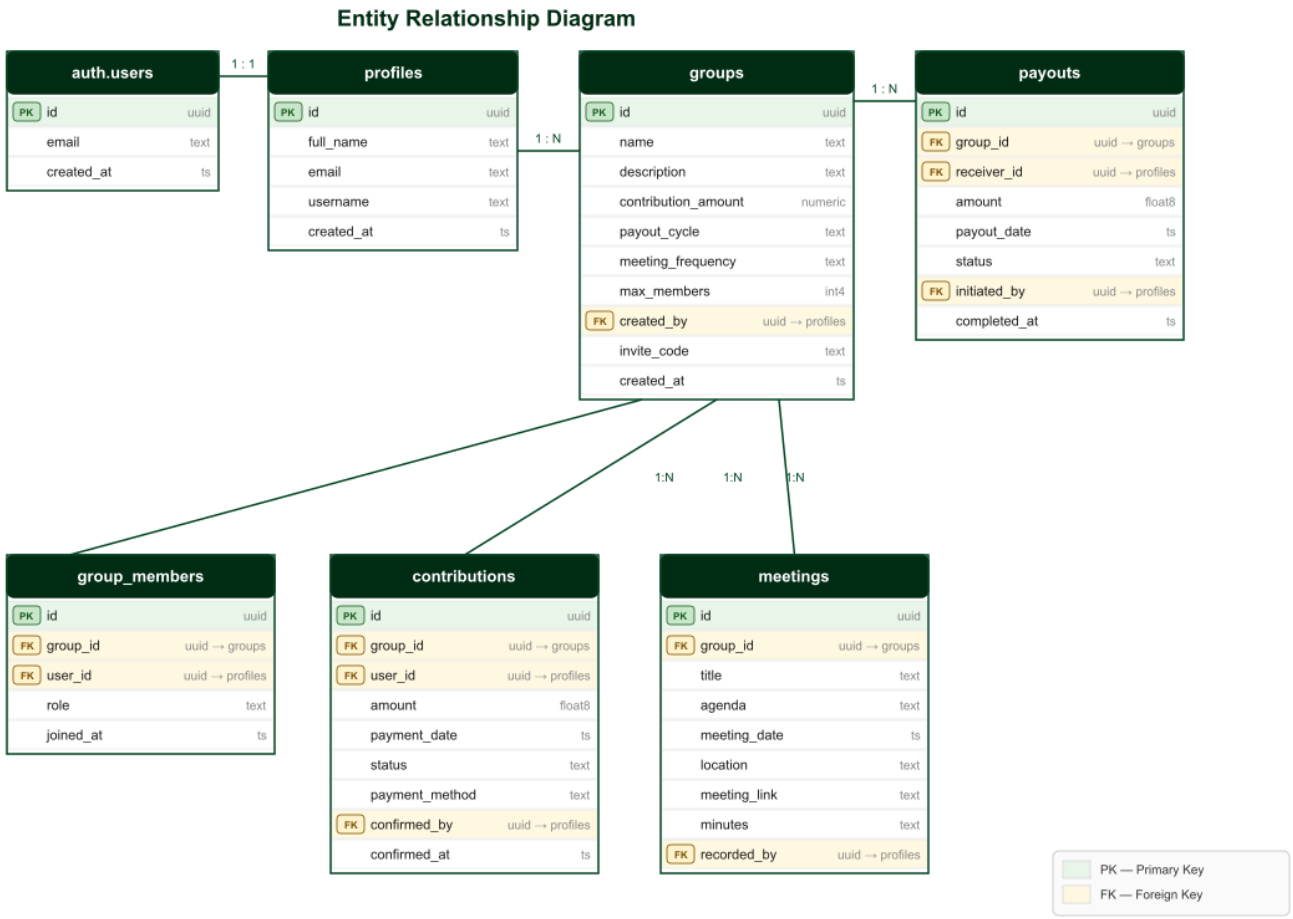
2. Component Diagram

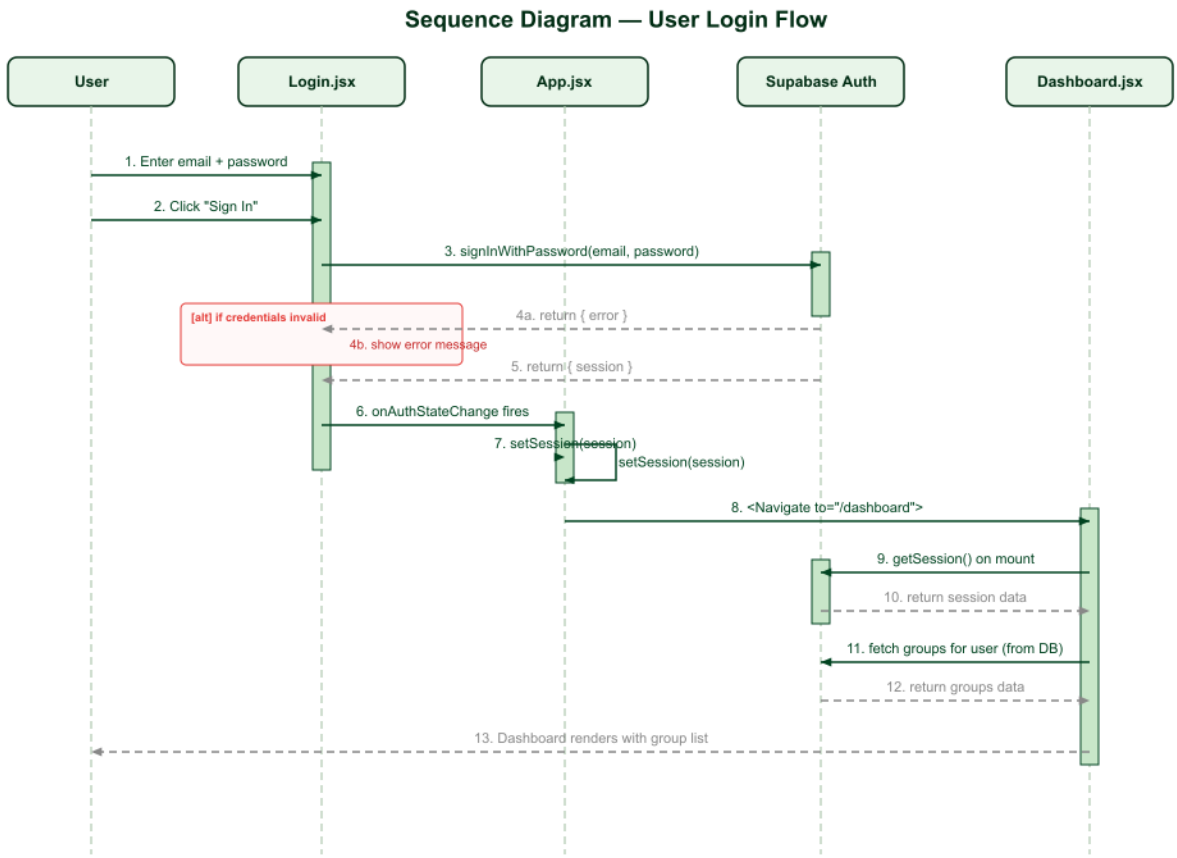
The browser renders React pages. React Router (controlled by App.jsx auth state) decides which page is active. Every page talks to Supabase Cloud via supabaseClient.js for data, and via the Auth SDK for session management.



3. Entity Relationship Diagram

Six tables in Supabase PostgreSQL. auth.users is managed by Supabase Auth. profiles extends it with display data. groups is the core entity — group_members, contributions, payouts, and meetings all reference it. Green = PK, Yellow = FK.



4. Sequence Diagram — Login Flow


Shows how a sign-in propagates: user enters credentials → Login.jsx calls Supabase Auth → onAuthStateChange fires in App.jsx → session state updates → React Router redirects to Dashboard → Dashboard fetches and renders group data.
